

DEVICE AND METHOD FOR SUCKING A BODY

ABSTRACT OF THE DISCLOSURE

A method for sucking a body through a sucking device, in which the sucking device includes a vacuum generator, a reservoir, a shield having at least one opening, a first tube and a second tube. The first tube communicates the shield with the vacuum generator and the second tube communicates the shield with the reservoir. The method comprising steps of: covering the shield on an area of the body; generating a negative pressure in the shield by the vacuum generator so as to gradually bulge the body area; and filling a filling medium into the shield from the reservoir for decreasing the negative pressure so as to restore the body area.
